

# Biochar Seed Compost

100%  
Peat  
free

Our Biochar Seed Compost is specially formulated for seed growing and uses a combination of biochar and organic coconut coir along with natural biology and vegetable fertiliser.

This combination means that your plants will need much less watering and when it's time to plant out or pot on, your transplanted seedlings will "take" quickly in their growing positions

## How to use

- » Fill pots with compost and pop the seed in a planting hole in the top as per the instructions on the seed packet
- » Cover the seed lightly with Seed Compost
- » Pat the top to ensure that the seed comes into contact with the compost
- » Lightly water the pot, but do not leave sitting in water
- » Make sure that the coir remains damp to ensure successful germination of the seeds
