

Biochar Soil Improver

A highly effective soil improver, that can help improve soil health and fertility in a natural and sustainable way. Its unique composition of biochar, microorganisms, and minerals can provide numerous benefits for plants, soil, and the environment.

Our Biochar Soil Improver contains high concentrations of multiple strains of mycorrhizal fungi and antagonistic Trichoderma, along with actinomycetes bacteria from wormcasts and trace minerals from seaweed.

- » Quicker establishment and root growth
- » Increased nutrient retention and microbial populations
- » Improved vitality
- » Requires less watering

How to use

Propagation or potting-on: Mix 45 grams (0.1L) of our Soil Improver into 1 litre of any substrate. Use in and around the roots of plants, as new plantings are introduced to new pots.

Soil production: Apply to growing areas for a targeted one-off application. 1 kg (2L) per m² of soil incorporated into the top 20-30cm of any soil type. If around existing planting, spread in the same way, fork in and mulch over to cover the product.
