GOLD®**

OPTIMUM YIELDS FROM SOIL NUTRITION

Arbuckle's believes the key to the healthiest plants, tastiest berries, and optimum yields is in soil nutrition. That's why they have been trialling Carbon Gold's enriched biochar Soil Improver since 2014.

“We're confident that Carbon Gold's Soil Improver will help to enhance the chemical, biological, and physical properties of soil.”

Stewart Arbuckle

Trialling since 2014

“We started trials on our strawberries, raspberries, blackberries and with particular focus on honeyberries back in 2014 with 2.4 tonnes of Soil Improver.

Although trials are ongoing and we haven't yet undertaken any major analysis of the results, we're confident Soil Improver will help to enhance the chemical, biological, and physical properties of our soil.”

Excited about enriched biochar

“We're expecting the porous structure of the biochar to hold more water and increase water and nutrient uptake in our plants.

We're particularly excited about the synergistic relationship with mycorrhizal fungi – these colonise the biochar structure and directly tackle nematodes to provide enhanced plant resilience, and also

mine important minerals for the plants.”

Soil first approach

“Soil Improver fits our ‘soil first’ approach and if the results of our trial meet our expectation we'll incorporate the product into our recommendations to growers of honeyberries as part of our LoveHoneyberry consultancy initiative – find out more at www.LoveHoneyberry.com.”
