Organics**

SEASON 1 YIELD INCREASE

Oirschot Organics came to us for a natural, Soil Association-approved solution to soil borne pests like nematodes or foliar issues such as botrytis, which were affecting yield.

“After the first year, we saw a reduction in nematodes in the soil and an unprecedented 10-15% increase in yield.”

Natural solution needed

“At Oirschot Organics we grow a number of vegetables, such as tomatoes, peppers, cucumbers, aubergines and courgettes. Because our crops are organic, there aren’t many natural, Soil Association and Skal approved products that can tackle soil borne pests; such as nematodes or foliar issues such as botrytis, which has affected and reduced yields in the past.”

Unprecedented results with Carbon Gold

“We approached Carbon Gold to help us tackle this problem and trialled Carbon Gold’s enriched biochar product, Soil Improver, on our tomatoes in both the soil and propagation pots in 2015 – we saw surprisingly good results!

Biochar is an organic product which is perfect for our operation and after the first year of using it, we saw a

reduction in nematodes in the soil and an unprecedented 10-15% increase in yield.”

Rolling out to full production

“This is why in 2016 we placed an even larger order with Carbon Gold and use it in all our propagation pots and in the soil. The Soil Improver is now a permanent part of our organic system.”
